I want to know my risk score.

THE ONLY BLOOD TEST THAT ACCURATELY IDENTIFIES RISK FOR AGGRESSIVE PROSTATE CANCER.
The 4Kscore Test accurately identifies the risk for aggressive prostate cancer.

Did you know most men who undergo a prostate biopsy do it as a precaution because PSA test results are too inconclusive?

Did you know that of the one million prostate biopsies performed each year only 20% are found to show life-threatening cancer?

That leaves 800,000 men every year who might not need a prostate biopsy if a more accurate blood test for aggressive prostate cancer existed.

NOW IT DOES!

Ask for the 4Kscore Test, it’s the only blood test that accurately identifies your risk for aggressive prostate cancer prior to a prostate biopsy.
What is Aggressive Prostate Cancer?
Prostate cancer is the most common form of cancer among men. But it’s important to note that there are two types of the disease. One is called high-grade prostate cancer, and this is the aggressive, life-threatening form of the disease. The other is called indolent prostate cancer, which is not life-threatening.

PSA testing CANNOT distinguish between aggressive prostate cancer, non-lethal indolent cancer, or no cancer.

- Most men with an elevated PSA DO NOT have prostate cancer but as a precaution undergo a prostate biopsy and endure the pain and possible complications associated with it, including infection and bleeding.

- About 80% of men who undergo a prostate biopsy based on a PSA test are found to have no cancer or to have the indolent form of the disease, which does not pose an immediate health risk.

- Most men will develop the non-life-threatening indolent form of prostate cancer as they get older. Treating indolent prostate cancer may not be necessary and may lead to erectile dysfunction and/or incontinence.

Wouldn’t you like to know your risk for aggressive prostate cancer before having a prostate biopsy?

Call toll-free 877-922-8364 to learn more, or visit 4Kscoretest.com.
The 4Kscore Test determines your risk for aggressive prostate cancer. The 4Kscore is the only blood test to assess your risk for aggressive prostate cancer prior to a prostate biopsy.

The test is 94% accurate in detecting aggressive cancer.¹

The biomarkers used in the 4Kscore Test were extensively tested by researchers from Memorial Sloan-Kettering Cancer Center on more than 10,000 patient samples. OPKO Lab developed and validated the 4Kscore blood test in a study of 1,012 patients that were recommended to undergo a prostate biopsy.

The 4Kscore is the only blood test that accurately identifies the risk of aggressive prostate cancer, and it’s providing a new option for men.

Now you can have the peace of mind that comes with knowing your care is being guided by the most accurate blood test ever developed to assess your risk for aggressive prostate cancer.

¹ Based on a 6% 4Kscore risk cutoff.

I want to know my risk score.
Am I a candidate?

Any man without a diagnosis of prostate cancer and being considered for a first or repeat prostate biopsy is a candidate for the 4Kscore Test. Please consult with your Urologist to see if your clinical history might exclude you from the use of the 4Kscore Test.

Won’t the 4Kscore Test lead to a prostate biopsy anyway, and aren’t biopsies covered by my insurance?

Not necessarily. The 4Kscore US clinical data shows 30-58% of prostate biopsies could have been avoided. The cost of a biopsy is $1,800-$2,200, and depending on your insurance coverage there may be a deductible, co-pay and/or “out-of-pocket” expenses for pre/post procedural materials and medication. Also, about 4% of patients develop an infection after a prostate biopsy that may lead to further costs and discomfort.
